## **Project: Grandfather Savely's Oasis**

Device type: Autonomous atmospheric moisture regeneration system

Mission: Every tree its own well. Turning invisible vapor into a source of life without consuming electricity.

---

## **Design (Structure and Images)**

The project is based on an honest view of physics: the best solutions are working structures, not beautiful pictures.

Aboveground unit (Turbine and Cyclone)

A standard roof turbine works as a mechanical "heart," drawing in air. A centrifugal cyclone cleans the airflow from sand, ensuring the system works for years.

Energy channel (Pipe-in-pipe)

An inner HDPE pipe delivers charged air to a depth of 3–5 meters. The outer pipe, made of thin stainless steel, serves as a conductor and reservoir.

Manifestation zone (Alpha and Omega)

Stainless steel removes the natural electrostatic charge from water molecules, causing them to "collapse" into droplets. The earth at this depth (about +8°C) acts as an eternal radiator, removing the heat of the phase transition.

Moisture transport (Capillary)

A geotextile wick raises distilled water from the bottom of the well to the roots, working on the same principle as a kerosene lamp.

---

## **Nutrition and Mineralization**

Distilled water is a "blank slate." To ensure the tree receives everything it needs, a mineral deposit is placed at the outlet of the wick. As water passes through it, it absorbs minerals and delivers a ready-made nutrient solution to the roots.

The system works in the tree's natural rhythm: water consumption is regulated by nature itself.

---

## **Beacon and Safety**

To monitor the oasis, the system can be supplemented with an autonomous radio beacon powered by a supercapacitor. If the turbine stops rotating, the station transmits a signal: "Repair needed."

---

## **Verdict**

This is the most honest system, where structure manages processes. Everything is simple, everything is banally simple — when you understand how to remove the charge and where to direct the heat.
